

Course Title	<b>Material Science and Engineering I</b>				
Course Code	<b>MME 155</b>				
Course Type	Compulsory				
Level	Undergraduate				
Year / Semester	1 <sup>st</sup> year / 2 <sup>nd</sup> Semester				
Teacher's Name	Theodora Kyratsi				
ECTS	5	Lectures / week	3+1 hours	Laboratories / week	1 hour
Course Purpose and Objectives	A course in understanding the structure-property relations of metals, ceramics, polymers and composites with emphasis on mechanical properties.				
Learning Outcomes	<ul style="list-style-type: none"> <li>• Define crystallinity, typical unit cells, density, Miller indices; crystal defects.</li> <li>• Describe the diffusion mechanism at atomic level.</li> <li>• Name and describe the two atomic mechanisms of steady-state and non-steady-state diffusion.</li> <li>• Read engineering stress-strain diagram and define elasti/plastic deformation, mechanical terms and properties (tensile strength, yield strength, Young modulus, Poisson ratio, ductility etc).</li> <li>• Describe strengthening mechanisms (grain size effect, solid solutions and cold-working) based on dislocations and define fatigue and creep.</li> <li>• Describe (qualitative) and analyze (quantitative) microstructures based on phase diagrams.</li> <li>• Describe heating processes of metals via isothermal transformation, annealing and precipitation.</li> <li>• Compare the mechanical behavior of metallic, ceramic and polymeric materials using stress-strain graphs.</li> <li>• Predict the mechanical properties of composite materials.</li> </ul>				
Prerequisites	None	Required	None		
Course Content	This course is the first part of the series “Materials Science and Engineering” and includes: Crystal structure; Unit cells – density – crystallographic directions and planes; Dislocations and Defects; Material microstructure; Diffusion – Elastic and Plastic Deformation; Stress vs Strain – Definition of Mechanical Properties (tensile strength, yield strength, Young modulus, Poisson ratio, ductility etc); Strengthening of metals (grain size, solid solutions, cold work); Failure of materials; Fatigue; Creep; Phase diagrams and phase transformations; Heat treatment of metals; Annealing; Precipitation Hardening; Characteristics of common alloys (i.e. perlite, benite, martensite, temper martensite), Processing and mechanical properties of metals and ceramics; Composite materials; Fiber Composites; Prediction of mechanical properties of composites made by known materials.				

	<p><b>Laboratory Exercises</b></p> <ul style="list-style-type: none"> <li>• Introduction to crystallography</li> <li>• Metallography</li> <li>• Phase diagrams</li> <li>• Impact test</li> <li>• Hardness test (Rockwell, Vickers)</li> </ul>
Teaching Methodology	<ul style="list-style-type: none"> <li>• Lectures</li> <li>• PowerPoint presentations</li> <li>• Laboratory exercises</li> <li>• Laboratory demonstrations</li> <li>• Communicative, Collaborative</li> <li>• During the first week of the semester, the course syllabus is given to students, which includes information on the course content, expected learning outcomes, assessment and office hours.</li> </ul>
Bibliography	<ul style="list-style-type: none"> <li>• Callister, W.D., <i>Materials Science and Engineering</i> (translated in Greek). Tziolas.</li> </ul>
Assessment	<ul style="list-style-type: none"> <li>• Midterm exam            35%</li> <li>• Final exam                50%</li> <li>• Laboratories              5%</li> <li>• Presentation              10%</li> </ul>
Language	Greek
