2011	BSc in Biology, Faculty of Biology, National and Kapodistrian University of Athens, Greece
2014	MSc in Experimental Molecular Biology, Department of Biological Sciences, Faculty of Pure and Applied Sciences, University of Cyprus
2014-Present	PhD Candidate in Biomedical Sciences, Department of Biological Sciences, Faculty of Pure and Applied Sciences, University of Cyprus

Research Topics:

- Investigation of the onset and progression of familial and sporadic renal disorders within the Greek and Cypriot population by the identification of new mutations as well as phenotype modifying variants in predetermined gene panels, mainly through the NGS technology and Sanger sequencing. The main purpose of this ongoing project is the development and the application of methodology for genetic screening of potential mutations and molecular diagnosis-prognosis of inherited glomerulopathies.
- Population and evolutionary genetics. Genotyping of biallelic and microsatellite markers of the Y-chromosome and associated phylogeographic analysis.
- Pharmacogenetics. Molecular genetic testing of genomic variations that are associated with drug metabolism in Greek-Cypriots.
